Is the Stress Pattern the Only Criterion of Noun Compounds?

SAORI TOMINAGA

1. Introduction

The definition of the term compound or compound word, which is made up of two (or more) words, is intolerably vague in spite of its frequent appearances in linguistic literature. In some cases of nominal compounds, the clear-cut distinction between noun compounds and simple noun phrases is difficult to make. It is often pointed out that the dividing line between compounds and syntactic phrases can be drawn on the basis of the stress pattern: If a given combination has single stress (1-1-) it is classified as a compound, whereas it is simply a syntactic phrase if it has double stress (1-1-). This is indeed the case with 1White House 'the official residence of the United States' and 1white house 'a house which is white,' where the former is a compound whereas the latter is a phrase.

Though the stress pattern criterion in distinguishing between compounds and phrases is generally applicable, it should be noted that this is not the one and only criterion. Besides its single stress, the compound 1White House has developed a special meaning which cannot be reduced to the simple semantic addition of the elements. We must also note that since compounds are single words, they display many word-like characteristics such as inseparability. Is it all right to forget the fact that the differences in their meanings and rigidity of their elements also play an important role in distinguishing them? This paper aims to show that the phonological criterion alone is not enough to prove the combination in question is a compound or a phrase. We must take into consideration semantic and paradigmatic factors as well.

2. Phonological Criterion in American Structuralism

Bloomfield (1933) pays attention to the fact that an English word usually has only one primary stress, which tends to be put on the first syllable. He clearly maintains that compounds and phrases can be distinguished according to whether the given combination has single primary stress or double primary stress, and entirely rejects semantic criterion:

In meaning, compound words are usually more specialized than phrases; . . . It is a very common mistake to try to use this difference as a criterion. We cannot gauge meanings accurately enough; moreover, many a phrase is as specialized in meaning as any compound: in the phrases a queer bird and meat and drink, the words bird, meat are as specialized as they are in the compounds jailbird and sweetmeats. . . . ice-cream ['aɪs-krɪm] is a compound, but ice cream ['aɪs krɪm] is a phrase, although there is no denotative difference of meaning (pp. 227–228).

Bloch and Trager (1942) also try to define compounds in terms of their stress patterns. They maintain that in order to distinguish compounds from phrases, some sort of formal criteria must be sought. As the criteria of compounds, they give phonemic modification, junctural change, stress pattern, and the combination of these features. They explain as follows:

Thus the compound blackbird differs from the phrase black bird only in stress; the compound altogether differs from the phrase all together in both stress and juncture; and the compound gentleman differs from the phrase gentle man in stress, juncture and modification of the second member from /man/ to /mən/.

1) In this paper, we use the marks (') and ('). The mark (') is put before the syllable that has primary stress, and the mark (') before the syllable that has secondary stress. In Random House College Dictionary 1991 (henceforth RHCD 1991) from which most of the combinations illustrated in this paper are derived, however, the mark (') follows the syllable having primary stress, and the mark (') follows the syllable having secondary stress.

2) Among American structural linguists, who strictly keep the notion of the "levels of analysis," an analysis of morphological structure must be made on the basis of phonology and semantic consideration is refused in this stage. Therefore the term compound is restricted to the combinations with single stress among them.
Marchand (1969) applies the stress pattern criterion to adjective + noun combinations though he adopts what he calls “underlying concepts” for others. According to him, a compound must display some morphological characteristic distinguished from the parallel syntactic construction. Therefore, in the case of adjective + noun combinations which is structurally identical with regular noun phrases and where the conventional stress pattern is double stress, single stress is regarded as the criterion of compounds. He states that “we could not modify the first elements of black market, Black Sea by very, yet the phrases are not compounds, as they do not enter the stress type of blackbird (p. 21),” and further he says “any syntactic group may have a meaning that is not the mere additive result of the constituents (p. 122).” He considers even ‘free’ wheel ‘a device in the transmission of a motor vehicle or rear bicycle wheel’ and ‘best man the chief attendant of the bridegroom at a wedding’ to be the examples of syntactic phrases because of their double stress. For him, phonological criterion sometimes overrides semantic criterion.

So far, we have seen that some linguists tried to characterize compounds and phrases in terms of their characteristic stress patterns. To what extent, however, are their attempts viable?

3. Semantic Criterion

Thus there seem to be some problems about making a distinction between compounds and phrases based on the stress pattern criterion alone. For one reason, it is often rather difficult to know with certainty whether a given combination takes single stress or double stress. In fact, the stressing of English compounds seems to vary considerably not only from dialect to dialect but also from individual to individual as the Webster’s Seventh New Collegiate Dictionary (1967) states as follows:

Some speakers stress a compound one way, and other speakers another way. To make rules that would cover the stress of compounds seems impossible. Certain conditions seem to make for one kind of stress or the other; these conditions leave the stress on many compounds unexplained (p. 1200).

According to Bolinger (1986), stress pattern vacillations often result from the semantically half fused nature of the combinations. Among such combinations we can find apple pie, ice cream, oatmeal, electric chair, etc. Note that these combinations are just in the period of transition from unfused phrases to highly fused compounds. Bolinger observes “there are speakers who say ‘apple pie, ice cream, oatmeal, and electric chair, and others who continue the older “phrasal stress” with ‘apple pie, ice cream, oatmeal, and electric chair (p. 117).” Accordingly, it is arguable to say that ice cream is a compound for some speakers while it is a phrase for others without considering the fact that the combination ice cream is semantically wavering between an unfused phrase and a highly fused compound.

This proves the difficulty to explain the difference between compounds and phrases only in terms of the stress pattern of the given combinations. We must take into consideration semantic characteristics as well, focusing on the ways in which a given combination has developed special meanings.

4. Paradigmatic Criterion

Besides the semantic criterion, we also need the paradigmatic criterion. The substitutability of the two elements is also considered to be crucial in distinguishing between compounds and phrases. A syntactic phrase allows high degree of substitutability in each element, and the meaning is clearly known from the semantic combination of the elements. Thus the first element of the simple phrase ‘red book ‘a book which is red’ may be freely replaced by blue, large, thin and so on without deviating from its structural meaning ‘a book which is . . . ’ In the same way, the second element of the phrase ‘old building ‘a building which is old’ may admit innumerable alternatives such as chair, man, book and so on without any effect to the semantic framework of ‘. . . which is old.’ All of these combinations can be classified as phrases because their elements admit very high substitutability typical of syntactic combinations.

On the other hand, the meaning of a compound is so solid that we cannot replace any of the elements without forfeiting its established meaning. For instance, if we replace the first element of ‘blue stocking by ‘white, the result is a nonsense word ‘white stocking. Thus, whether the elements
of a combination can be replaced by others freely or not is highly important for the distinction between compounds and phrases.

5. Phrase-like Combinations with Single Stress

When we reexamine all the combinations taking these semantic and paradigmatic criteria into consideration, we can find many single-stressed combinations which are akin to phrases.

5.1 Single-stressed combinations often occur when they consist of a verb-derived noun at the second element and the semantic object at the first element: That which or a person who —s X generally take the stress pattern X —er. Thus we have a large number of combinations with maker in the second element;

\begin{itemize}
  \item car maker, coffee maker, dress maker, noise maker, pace maker
  \item peace maker, trouble maker, watch maker
\end{itemize}

This combination pattern X-maker is so productive that we can easily create such nonce words as pilano maker, tube maker with single stress. We can cite a large number of examples of this sort; English teacher, fortune-teller, lie detector, pen holder, sun-worshiper. More generally, this phenomenon is widely seen in the combinations with verbal nouns in their second elements. For instance, bed making, fox hunting, house keeping, are the cases with gerunds, and blood test, flower arrangement, production control are the cases with verb-derived nouns. Since they always take single stress, they appear to be compounds with respect to the phonological criterion. For this type of combinations, however, the single stress is only a syntactically determined stress pattern. Considering the fact that they admit of a fairly large number of substitutable alternatives in their first element and that they have transparent, combinatorial meanings, we might regard them as phrases rather than compounds.

5.2 Single-stressed combinations often result when the second elements are rather general in their meaning and less informative than the first element, or also when the contrast with other combinations is intended on their first elements. The words such as disease, land, room, school, and system which frequently occur in the second element of a combination are less important than the first elements which are the modifiers, and this explains their single stress:

\begin{itemize}
  \item Alzheimer’s disease, Hansen’s disease, Parkinson’s disease, dreamland, flatland, highland, dressing room, guest room, rest room, grammar school, military school, night school, feudal system, decimal system, nervous system.
\end{itemize}

Here again, they are apparently compounds in that they have single stress. But this time, their stress pattern seems to be determined by semantical or pragmatical factors. They may be similar to syntactic phrases rather than to compounds in that they admit high degree of separability and substitutability and exhibit combinatory meanings which often characterize syntactic phrases.

6. Compounds with Double Stress

On the contrary, we can also find a large number of double-stressed combinations whose other properties suggest that they are compounds. They are apparent simple phrases in that they have double stress. From substitutability and semantic points of view, however, they have more or less fused meaning and consequently each element of the combination is rather fixed and allows very low degree of substitutability. Examining some entries in English dictionaries, we can find a number of such combinations. In what follows, I would like to show such combinations of adjective + noun that I collected chiefly from RHCD.

Double-stressed compounds are divided into two groups according to their semantic nature: endocentric compounds and exocentric compounds (Bauer 1983: 30). In the first group, the compound is a hyponym of the grammatical head which is the second element. Here what we often find is the specialization of meaning of the whole combinations.

On the other hand, since the compound in the second group is not a hyponym of the second element, specialization of meaning is not often applicable. Actually, what we find about this group is transfer of meaning rather than specialization of meaning; a completely different sense from the sense of the second element is given to the whole combinations.
...fer of meaning is a kind of figure of speech, in which our conceptual association connects the literal (or sometimes already specialized) meaning with the transferred meaning. Combinations in this group fall into two categories according to their kind of association underlying them: similarity and contiguity.

In the next two sections, I consider double-stressed combinations which have changed in meaning. To those used as technical terms or jargon, technical labels are added in the abbreviated forms put in parentheses immediately after the examples. Note that polysemic combinations are being entered into separate categories according to their difference in meaning. Cross-references are available by arrow signs.

6.1. Specialization of Meaning (A)

6.1.1. There are many double-stressed combinations which have been so specialized in meaning that we can hardly deduce their meaning from the additive sum of the elements. In some cases, specialization of meaning has not gone further enough to fail to derive their correct meanings:

'big toe', 'little toe', 'little finger'.

However, they can be modified by the adjectives whose meanings are contradictory to the first adjective elements and not by very, which proves that they have undoubtedly attained a certain level of "compoundness." Thus, we can say little 'big toe, but we cannot say very 'big toe in this meaning.

6.1.2. Semantic specialization very often results when a combination with additive meaning is in a certain group of people or in a particular field of activity or profession. These examples range from slightly to highly fused combinations. In spite of their double stress, we can no longer derive their meanings exactly from their general meaning or refer to such combinations as simple syntactic phrases.

1) 'black/brown/white belt (Judo) waistbands → C, 'black 'letter (Print.) a heavy-faced type, 'blue 'ribbon: first prize → B, 'broad/narrow 'gauge (Rail.) distances between the rails, 'compact 'disk (Electron.), 'double 'bar (Mus.) a double vertical line on a musical staff, 'dry 'eye (Path.) an abnormal eye condition, 'First 'Family/Lady, 'first 'night (Theatr.) evening of the first performance, 'flappy 'disk (Comp.), 'free 'agent (Sports), 'free 'wheel: a device in the transmission of a vehicle, 'full house (Theatr.) an occasion when every seat is occupied → B, 'green/ 'red/ 'yellow 'light: traffic lights → B, 'grand 'tour: an extended tour of Europe formerly made by young British gentlemen, 'Great 'War: World War I, 'hard 'disk (Comp.) a rigid disk for storing large amounts of data, 'hard/ 'soft 'lens (Opt.) contact lenses, 'heavy/ 'light 'metal (Chem.) kinds of metals → B, 'heavy 'water (Chem.) water in which hydrogen atoms have been replaced by deuterium, 'high/ 'low 'wing (Entom.) second or posterior wings, 'high(-) 'hat: a top hat, 'lost 'Generation (Liter.), 'lost 'tribes (Bibl.) ancient Israeli taken into captivity, 'lower/ 'upper 'case (Print.) trays for holding small/capital letters → C, 'middle 'distance (Paint.) the part between the front and the back, 'missing 'link (Zool.) between the anthropoid apes and humans, 'near 'miss (Aeron., Mil.), 'new 'Style: of the Gregorian calendar, 'New/ 'Old 'World, 'next 'friend (Law) other than a guardian, 'old/ 'Middle/ 'Modern 'English (Ling.), 'old 'master (Paint.) an eminent artist of an earlier period → C, 'oval 'office: in the White House, 'red 'carpet: for welcoming important visitors, 'red 'hat (Cath.) the official hat of a cardinal → C, 'short/ 'long 'wave: radio waves, 'Siamese 'twins (Med.) twins joined by fleshly band, 4) 'slow 'motion (Movies or TV), 'soft 'soap (Chem.) the semifluid soap → B, 'special 'effects (Movies or TV), 'third 'degree (Law) intensive questioning and rough treatment in order to get a confession, 'white 'elephant: award by the King to a disagreeable courtier → B, 'white 'flag: symbol of surrender, 'yellow 'card (Sports) a warning.

3) Full forms of the abbreviated subject labels used in this paper are as follows:

Aeron./aerics  Cath./olic  Liter.+/ature  Path./ology
Anat./omy  Comp./uting  Med.+/icine  Print.+/ing
Astron./omy  Cook./ing  Mil.+/ary  Rail.+/way
Bibl./ical  Electron./ics  Mus.+/ic  Theatr./ical
Bot./any  Entom./ology  Opt.+/ics  Zool.+/ogy
Chem./istry  Ling.+/istics  Paint.+/ing

4) This combination originated with two Siamese men (1811–74) who were congenitally joined together.
6.1.3. There are a few extreme cases in which the original meaning of a combination has completely disappeared.

'best man': the chief attendant of the bridegroom at a wedding.  
'black box (Aeron.) flight recorder,'  

Note that these are not combinations "semantically transferred" in that the referent has always been the same. However, they can be considered examples of radical specialization due to historical change or usage limitation. Their "compoundness" is supported by the possibility to put an adjective whose meaning is contradictory to the first adjective element before the combination

an undesirable 'best man'  
and  
an 'orange 'black 'box

are completely acceptable. In these combinations adjectives 'best' and 'black' have lost their original function as modifiers and are totally fused with the following nouns.

6.2. Transfer of Meaning

When the meaning of a combination of words transferred from one field of sense to another, we often find it difficult to derive its meaning. Such combination is no longer simple phrase in that its meaning is not reducible to the mere additive sum of the components, and that it allows less substitutability on each component.

6.2.1. Transfer of Meaning Based on Similarity (B)

Semantically transferred combinations fall into two categories in terms of the kind of association between the literal (or sometimes already specialized) meaning and the transferred meaning. Combinations based on some kind of similarity or common feature in their form, state, or function, which are generally referred to as metaphor, form one group. The following are the examples whose meanings are transferred on the basis of similarity and hence cannot be considered hyponyms of the second elements.

6.2.2. Transfer of Meaning Based on Contiguity (C)

Those based on some kind of relation other than similarity, that is, contiguity — spatial or temporal proximity — form another group. They are sometimes referred to as metonymy. Some of them have a producer-product or container-content relation, and the like. Within the metonymic relations, the relation of 'part for the whole' is so remarkable that it is often treated as a separate category under the heading of synechdoche. Combinations based on contiguity are as follows:

'big name: a recognized leader, 'black/brown/white belt (Judo) an
expert/intermediate/beginning player ← A, blue helmet: a UN peace-keeping force, greasy spoon: a cheap and unsanitary restaurant, lower upper case (Print.) small/capital letters ← A, old master (Paint.) a work by an eminent artist ← A, Red Cross, red hat (Cath.) a cardinal ← A, red tape: unnecessary official rules that delay.  

7. Conclusion
As we have seen, English compounds are not always single-stressed. There exist many double-stressed compounds with high degree of fused meanings and low degree of substitutability of components. On the other hand, there are also many single-stressed combinations to which we hesitate to refer as paradigm examples of compounds. They admit high degree of element substitutability and still exhibit compositional, transparent semantics. Thus, the clear-cut formula which distinguishes between compounds and phrases based solely on the stress pattern would lead to the misclassification of these two types of combinations.

To recap, we need not only phonological but also semantic and paradigmatic criteria in regarding a given combination of words as a compound or a phrase.

Acknowledgement
I should like to thank Mr. Tetsuya Koshiishi and Mr. Riichiro Matsumoto for carefully reading the manuscript and giving me helpful advice and invaluable comments. I also want to express my gratitude to Prof. Shigeru Takebayashi who kindly suggested improvements to the earlier versions of the present paper and gave me encouragement to attain this paper.
